

Harnessing Data for Enhanced AAC Outcomes: A Realize Language Workshop

Freya Allen
Leah Cardwell and Delara Kapadia

Short Abstract

This practical workshop explores Realize Language, an innovative online tool that transforms raw language samples into actionable insights for Augmentative and Alternative Communication (AAC) communicators. Understanding and leveraging data is crucial for informed decision-making and tailored interventions.

The Realize language tool can be used across multiple hardware and software options, including Liberator Rugged, NovaChats, Accents, and iOS apps LAMP Words For Life and Touch Chat. Designed for parents, speech pathologists, and educators supporting AAC, Realize Language offers robust, user-friendly tools to document and analyse crucial aspects of language and communication development. Its collaborative features enable transparent information sharing among the team.

Realize Language can be used to provide valuable information on when, where and how the AAC system is being used. It provides a comprehensive view of a client's language use, enabling therapists to set targeted goals, strengthen funding applications and measure progress effectively.

Through hands-on activities and real-world data analysis, we will:

- Interpret key language metrics to inform AAC intervention strategies
- Select vocabulary targets based on current usage patterns
- Set measurable, evidence-based goals
- Conduct in-depth language sample analysis
- Measure vocabulary growth
- Monitor progress with literacy development
- Identify words for programming.

Join us to discover how Realize Language can revolutionize your AAC practice by bringing client data to life and informing evidence-based interventions.
